

(a) the Blind Harbor Transit

(b) information staleness

|                     |                            |
|---------------------|----------------------------|
| own odometry        | 50 Hz                      |
| own cable direction | 20 Hz                      |
| neighbor estimates  | $\tau$ -stale (0.05–1.6 s) |
| beacon (one agent)  | 5 Hz, dock only            |

the price of staleness:

error-transport holonomy  $\propto \tau^2$  [PROVEN, both plants]

closed-loop floor: measured slope  $\approx 1.08$  [CON] regime]
