

(a) pre-anchor floor vs λ_2
(cycles degrade with N ; complete flat)

(b) gauge PIN rate vs λ_2 — Cor 5.2 observable
Spearman +0.04: anchor-limited, NOT connectivity-limited

(c) D re-agreement rate vs λ_2
Spearman -0.51 [-0.65, -0.36]: stiff consensus resists the p

N labels annotate points; $N = 3$ (faded) is demonstration-only ($C_3 = K_3$). The in-domain contraction claim (E2: rate $\propto \kappa \lambda_2$, frozen/unanchored) PASSED; the anchored closed-loop extrapolation fails per the ES-01 finding path: pinning is anchor-rate-limited, and re-agreement anti-orders with connectivity — connectivity buys agreement (panel a), not anchoring (panels b, c). Ring -2 row: under-powered as pre-declared.
