

(a) amplitude object — C9b': first-order in ε
(base commutator exactly zero) — PASSED

(b) closed-loop floor excess — C9b [CONJ]:
falsifier MET — seed-paired slope 1.58 [1.44, 1.84], 2 and 1 excluded

Two objects, two panels, never mixed (plan §4.3). Panel (a) is the theorem-adjacent amplitude; panel (b) is the conjectured D_{ss} regime under the ADJUDICATED seed-paired estimator (the unpaired C_I is under-powered and adjudicates nothing; segment slopes rise $1.2 \rightarrow 2.1$ — a linear+quadratic mixture the registered single-power model mis-specifies). Robust suppression (jitter 20%, drops 10%): $2.75 \times [1.94, 3.89]$ ratio of arm means — the $\geq 10 \times$ falsifier TRIPS; large symmetric protection lives on the amplitude object only ($31 \times$ Drake, exact 0 Tier-1).
