

F4a-overlay: Thm 7.2's object on two independent plants

Thm 7.2 (leading-order, deterministic; PROV): $\|\text{Log Hol}\| = O(\tau^2)$, holonomy built from the conjugated error generators. Drake generators use the estimator's own closed-loop shape/twist states ($l = 12$ m); the τ -law is the theorem's prediction — the measured content is the coefficient, the switch-offs, and the $O(\tau^3)$ departure.
