

(a) amplitude object — C9b': first-order in ε
(base commutator exactly zero)

(b) closed-loop floor excess — C9b: slope 1.58 [0.43, 2.89]
(2 in CI, not falsified; segment slopes rise 1.2→2.1)

Two objects, two panels, never mixed (plan §4.3). Panel (a) is the theorem-adjacent amplitude; panel (b) is the conjectured D_{ss} regime. Robust suppression (jitter 20%, drops 10%): $S = 2.75 \times [1.94, 3.89]$ — the $\geq 10\times$ headline falsifier TRIPS on Tier-1 as on Drake; large symmetric protection lives on the amplitude object only (31 $\times$, exact 0).
