

(a) C6 — contraction rate vs consensus strength

(b) C19 — log-linearity remainder: vanishes FASTER than second order (falsifier band excluded on the favorable side)

Rate prediction holds for the frozen linearization (Thm 6.3, an inequality; μ calibrated at $\kappa=0$, so the identity line is anchored, not predicted); the nonlinear extension is open. Whole-vector rates (v1); per-subspace split pending.
